.0		
	at are the six types of essential nutrients (components of foodsturnutrition)?	ffs necessary fo
	• W	
	• C • V	
	PM	
	• F	
2.	Water composes% of a horse's body weight?	
	12-25% 35-45% 50-65% 65-70%	
3.	If you removed all the water from a 1000 pound horses body he approximately weigh? (circle) 700 lbs 900 lbs 650 lbs	e would 350 lbs

4. Answer True or False for the next statements.

	 5% of the horse's water is found in the blood vessels (<i>intravascular space</i>) 15% of the horse's water surrounds the blood vessels and all the cells of the horse's body (<i>extracellular space</i>) 50% of the horse's water is found inside all of the cells in the horse's body (<i>intracellular space</i>) 30% of the horse's water is found in the gut (the large intestine and caecum)
5.	Name 1 use for water in each of the following systems: • Digestion • Blood • Lymph • Urine • Feces • Skin • Eyes and nostrils • Milk • Joints
6.	A horses stomach holds 3-4 gallons of fluid. How many gallons can a horse drink at one sitting?
7.	A stabled horse requires 5-10 gallons of water a day. <i>Circle the correct answer</i> . Does a lactating mare require more or less? Does an event horse require more or less? If the weather is hot does, a horse require more or less?
8.	15% loss of water which is not replaced is called
9.	Name 5 possible causes of(answer to #8). •
	What is the pinch test?How fast should the skin return to normal?How would you perform the pinch test?What does it mean when it takes longer than normal for the skin to return to its normal positon?What is thumps (synchronous diaphragmatic flutter)?

12.	12. Nutrients that are made up of sugars, starches and cellulose are called		
	s?		
13.	These 3 components of #12 provide the major source of energy and are found in? <i>Circle all that apply:</i> corn, oats, barley, grass, oat hay, alfalfa, timothy hay, corn oil, safflower oil.		
14.	Which are higher in carbohydrates? (circle) concentrates or roughage.		
15.	If you wanted to increase the energy in a hard working horses diet, would you increase his grain or his hay (roughage) proportion of his diet?		
16.	What would a horse look like and how would you expect him to act if he were deficient in carbohydrates?		
17.	Rank the following feeds from highest to lowest in carbohydrates: oats, barley, corn, alfalfa hay, grass hay, flax seed, beet pulp.		
18.	Ps are the building blocks of life and make up 22% of horses weight.		
19.	They are made up from many different combinations of 22		
20.	10 are essential because the horse must get them in his food and cannot synthesize (make them) himself. (For the HA candidates: lysine, histidine, isoleucine, methionine, phenylalanine, threonine, tryptophan, leucine, arginine, valine)		
	12 are calledessential because the horse can make them from other amino acids.		
22.	Proteins are found in all of the following <i>except</i> : (circle) hair, hooves, tears, cell walls, hormones, nervous system, fat, enzymes, blood, skin, milk, muscle.		

24. What is the general percentage of protein in grade 1 oats?		23. Rank the following feeds from highest to lowest in protein: grass hay, oats, alfalfa, pasture grass, rice bran, wheat bran.		
light work? Pregnant mares? Mature horses in no work? Lactating mares? Two year olds? 26. What is the general percentage of protein in midbloom alfalfa? 27. How much does a bale of alfalfa cost? 28. What might you expect a horse to look like if he is deficient in protein? 29. What problems can excessive protein lead to? 30. Fats ("lipids") are present in the normal horses ration in approximately 10-12% 8-10% 2-3% 20-40% 31. Fats contain x's the energy found in equal amounts of carbohydrates or proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn		24. What is the general percentage of protein in grade 1 oats?		
27. How much does a bale of alfalfa cost? 28. What might you expect a horse to look like if he is deficient in protein? 29. What problems can excessive protein lead to? 30. Fats ("lipids") are present in the normal horses ration in approximately 10-12% 8-10% 2-3% 20-40% 31. Fats containx's the energy found in equal amounts of carbohydrates or proteins.		light work? Pregnant mares? Mature horses in no work?		
28. What might you expect a horse to look like if he is deficient in protein?		26. What is the general percentage of protein in midbloom alfalfa?		
29. What problems can excessive protein lead to? 30. Fats ("lipids") are present in the normal horses ration in approximately 10-12% 8-10% 2-3% 20-40% 31. Fats containx's the energy found in equal amounts of carbohydrates or proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids		27. How much does a bale of alfalfa cost?		
30. Fats ("lipids") are present in the normal horses ration in approximately 10-12% 8-10% 2-3% 20-40% 31. Fats contain x's the energy found in equal amounts of carbohydrates or proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids				
10-12% 8-10% 2-3% 20-40% 31. Fats containx's the energy found in equal amounts of carbohydrates or proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids	29. What problems can excessive protein lead to?			
31. Fats contain x's the energy found in equal amounts of carbohydrates or proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids	30. Fats ("lipids") are present in the normal horses ration in approximately			
proteins. 10 x's 50x's 21/2 x's 5 x's 32. Fats are contained in all feedstuffs for horses but in varying amounts. List the following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids		10-12% 8-10% 2-3% 20-40%		
following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil, Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids				
Oats, Flax Seed, Corn 33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids		32. Fats are contained in all feedstuffs for horses but in varying amounts. List the		
33. Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids		following feeds from highest fat content to lowest: Alfalfa, Rice Bran, Corn Oil,		
		Oats, Flax Seed, Corn		
because they must be contained in the diet and the horse cannot make them.	33.	Arachidonic acid, linoleic acid, and linolenic acid are calledfatty acids		
		because they must be contained in the diet and the horse cannot make them.		

34. Fats are essential for: (True or False)		
• Aid in the absorption of fat soluble vitamins		
Provide energy		
Store energy in horse's body		
Spare protein by being metabolized for energy in place of protein		
• Found in mare's milk		
• Increase stamina in a performance horse when added to his diet - especially endurance and event horses		
• Increase the palatability (tastiness) of manufactured feed supplements		
35. What are the signs of a horse fed too much fat?		
36. Vitamins are organic (non-mineral) substances that are required in small amounts to regulate certain chemical reactions of metabolism in the body. There are 2 kinds those that dissolve in fat or vitamins and those that dissolve in water or vitamins.		
37. Fat soluble vitamins can be stored or accumulate in the body; therefore they can be overfed and cause problems. These vitamins are &		
38. Water Soluble vitamins are not stored in the body and the horse needs some every day. These vitamins are &complex vitamins.		
39. Which Vitamin(s) is/are responsible for:		
• Maintains integrity (healthiness) of skin, eyes, mucous membranes and bone development		
• Promotes proper absorption and metabolism of calcium and phosphate which enables good bone formation		
• An antioxidant which protects cells from damage, essential for growth and stallion fertility		
Involved in normal blood clotting		
 Needed for normal red blood cells –if insufficient amounts the horse will be anemic & 		
• This group of vitamins is responsible for metabolism of carbohydrates, proteins and fats and is important for normal nervous system function		

	Important for the formation of collagen (a vital component of cartilage and other y tissues) – this vitamin is made by the horse and does not need to be supplemented
	Name the 6 macro-minerals (required in larger amounts):
	Name 9 micro-minerals also known as trace elements:
42.	Micro- minerals are usually found in sufficient quantity in good quality hay and do need to be supplemented. (circle) True False
	Name the 2 most common minerals in the horses body – found in bone
	Main electrolyte found in extracellular fluid and plasma&k nown as salt.
45. ——	This mineral is a component of hemoglobin which carries oxygen to the cells
46.	This micro-mineral is necessary for normal thyroid function

Points to remember when balancing a ration:

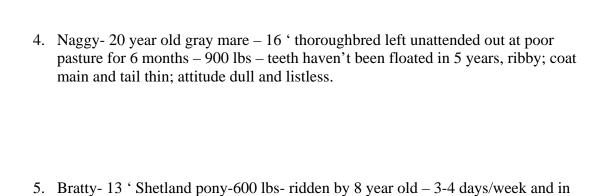

- Horses require from 1.5-3.0% of their body weight in hay and/or grain depending upon the amount of work, and other factors such as age, climate, temperament, etc
- Young horses and pregnant mares in last 3 months require 2.5-3.0% of body weight
- Minimum amount of roughage to be fed for good gut function is 10%.
- Protein requirements approximate: 7.5-8.5% light work and medium work; 8.5-10% for hard work and strenuous work; pregnant mares 8-10% Mares in last 3 months of pregnancy 11-13%; lactating mares 14% gradually decreasing to 12%; Weaned foals 14.5-16%; yearlings 12-14%; 2 year olds 10-12%; 3 year olds 8.5-10%. Do not exceed 10% in the adult horse ration.
- Calcium: Phosphate Ratio must be 3:1 or less ideal closer to 2:1
- 1 mega calories (Mcal) = 1000 Kilocalories (C)
- If you weighed 100 lbs and require approximately 2400 kilocalories (C) per day and horse weighs 1000 lbs –he will require 10x's your needs or 24,000 C's per day or 24 Mcal.

A guide to feed requirements for Work

Work Category	%Hay	% Concentrate
Maintenance	100	0
Slow light work	85	15
Light Work	80	20
Medium Slow Work	70	30
Medium Work	60	40
Hard Work	40	60
Race Training	30	70

What type of feeding regimen would you suggest for the following horses:

- 1. Lazy George 15'3" 9 years old; 1000 lbs; good health, teeth floated; owned by older lady, ridden 3 times a week on the trail for 1.5 hrs at a time.
- 2. Pirate Lion 16'2" advanced event horse; 1100 lbs ridden by David Bruceson; ridden 6 days a week advanced event fit
- 3. Tevis Arabian 15'1" 950 lbs, ridden 2-3 hours/day (75-100 miles/week) competing in 50 and 100 milers.
